

AI Training Program

Practical AI Skills for Students & Teachers

This training program is designed specifically for students and teachers with non-technical backgrounds. The goal is to build practical AI literacy, responsible AI usage habits, and hands-on productivity skills using modern AI tools.

Audience: Students and Teachers (Non-Technical Backgrounds)

Program Duration: 10 Weeks

Format: Weekly 2-hour interactive sessions

Approach: Practical, Beginner-Friendly, Hands-On

Why This Program Is Important

- AI tools are rapidly becoming part of education, research, administration, and communication.
- Most students and teachers use AI tools without understanding their strengths, risks, or limitations.
- Organizations increasingly require AI-aware professionals who can use AI responsibly and productively.
- The program focuses on real-world implementation instead of technical theory-heavy instruction.
- Participants learn how to use AI safely, critically, and effectively in academic and professional environments.

The curriculum emphasizes practical AI implementation through live demonstrations, AI-assisted workflows, productivity use cases, prompt engineering, automation concepts, and beginner-level AI agent design.

Key Outcomes for Students & Teachers

- Understand AI concepts in simple, non-technical language
- Use AI tools for teaching, learning, writing, research, and planning
- Write effective prompts to improve AI-generated results
- Evaluate AI outputs critically instead of trusting them blindly
- Build AI-assisted productivity workflows
- Understand AI ethics, privacy, hallucinations, and responsible usage
- Design beginner-level AI automations and agentic workflows
- Develop confidence using modern AI tools in daily academic and workplace tasks

Program Roadmap

Week	Topic	Practical AI Focus
1	Digital Foundations & AI in Daily Life	Understanding modern AI systems
2	Data, Internet & APIs	How AI systems use and exchange data
3	Programming Logic Without Fear	Workflow and automation thinking
4	AI & Machine Learning Fundamentals	How AI learns patterns from data
5	ML Workflow & Deep Learning	Understanding modern AI systems practically
6	LLMs & Generative AI	Using ChatGPT and modern AI assistants effectively
7	Prompt Engineering	Writing better prompts for better results
8	AI Productivity Workflows	Practical AI implementation for study/work
9	AI Agents & Automation	AI workflows, tools, and automations
10	Capstone & Showcase	Building a practical AI-assisted solution

Every week includes live AI demonstrations, practical activities, guided exercises, and hands-on assignments focused on real-world use cases.

Practical AI Implementation Focus

- AI-assisted lesson planning and content creation
- Research summarization and document analysis
- Meeting notes to action-item workflows
- AI-supported writing and communication
- Prompt engineering for productivity and teaching
- Workflow automation using no-code tools
- AI-powered study support and revision planning
- Building simple AI agents and assistant workflows

Example Hands-On Activities

- Comparing weak prompts vs strong prompts
- Using AI tools to summarize lecture notes
- Building AI-assisted productivity workflows
- Evaluating hallucinations and fact-checking outputs
- Designing beginner-friendly AI automations
- Creating capstone workflows for education or workplace tasks

AI Tools & Platforms Used

Category	Example Tools	Purpose
AI Assistants	ChatGPT, Gemini, Copilot	Writing, summarization, brainstorming
Research Tools	Perplexity, NotebookLM	Research and document Q&A
Automation	Zapier, Make, n8n demos	Workflow automation
Visual & Productivity	Canva AI, Google Docs	Content and presentation creation
Data & APIs	Google Sheets, Hoppscotch	Basic AI workflows and APIs

Responsible AI & Safety

- Participants learn to verify AI-generated information
- Privacy and sensitive data handling are reinforced throughout the course
- Students learn about hallucinations, misinformation, and AI limitations
- Human review and accountability are treated as essential workflow components
- The program encourages critical thinking rather than blind AI dependence

Final Capstone Project

Participants complete a practical capstone project where they design an AI-assisted workflow or beginner-friendly AI solution for a real problem.

- AI study assistant for students
- Teacher lesson-planning workflow
- Research summarization assistant
- AI-powered FAQ support workflow
- Weekly planning and productivity assistant
- Content drafting and communication workflow

Each project includes workflow diagrams, prompts, AI tools, example outputs, risks, and human review points.

Value to Educational Institutions

- Improves AI literacy across students and teaching staff
- Encourages responsible and safe AI adoption
- Enhances productivity and digital confidence
- Builds future-ready workforce and academic skills
- Supports innovation in teaching, learning, and administration
- Creates awareness of both AI opportunities and risks

Conclusion:

This AI Training Program provides a structured, practical, and beginner-friendly pathway for students and teachers to understand and apply modern AI tools responsibly. The curriculum combines AI literacy,

prompting, productivity workflows, automation concepts, and hands-on implementation to prepare participants for an AI-driven future.
